

SMART WATER BOTTLE USING IOT

FIELD OF INVENTION

The present invention is based on the smart water bottle technology based on IOT.

BACKGROUND OF THE PRESENT INVENTION

The current invention is a smart water bottle that uses technology to keep people hydrated and live a healthy lifestyle. Dehydration is a frequent disease that affects people of all ages and can lead to a number of health issues. Many individuals find it difficult to remember to drink enough water throughout the day, particularly when they are busy or on the go. The smart water bottle is intended to address these difficulties by giving hydration reminders and tracking tools. It has sensors that detect when the bottle is full or empty, as well as a display that shows the user's hydration status and how much water they need to drink to fulfill their daily hydration target. Smart water bottle technology is a combination of hardware and software that is supposed to be user-friendly and intuitive. Overall, the smart water bottle is a one-of-a-kind and inventive solution to dehydration that blends technology with a practical and useful design. It has the potential to improve the health and well-being of millions of people throughout the world by making staying hydrated throughout the day easier and more convenient.

LITERATURE GAPS

The gaps observed in the literature are listed below:

1. Lack of comprehensive studies on the health benefits of hydration
2. Limited research on the effectiveness of hydration reminders
3. Limited research on the effectiveness of hydration tracking device

OBJECTIVE OF THE INVENTION

The main objectives of the invention are

- Is to provide a novel and innovative solution to the challenge of tracking and promoting hydration levels in individuals.
- Basic hydration trackings, such as personalized recommendations based on individual hydration needs, behavioral feedback, and insights into the health benefits of hydration.

- Is to Provide a smart water bottle that can accurately measure hydration levels and provide personalized feedback and recommendations to help users optimize their hydration levels for improved health and wellness.

DETAILED DESCRIPTION OF THE ELEMENTS

1. Temperature sensors

The smart water bottle should also include temperature sensors to monitor the temperature of the water inside the bottle. This information can be used to provide personalized recommendations on the ideal temperature for optimal hydration based on the user's needs and preferences.

2. Customizable reminders

The smart water bottle should include customizable reminders to help users stay on track with their hydration goals. These reminders may be based on individual hydration needs and preferences and may include notifications via the smart water bottle app or other connected devices.

2. Ultrasonic Sensor

The ultrasonic sensor is used to detect the presence of water in the bottle and to measure the water level. The sensor uses sound waves to determine the distance between the sensor and the surface of the water. This data is then used to calculate the water level in the bottle. The ultrasonic sensor can also be used to track water consumption and remind the user to drink water if they haven't done so in a while.

3. Water Level Sensor

The water level sensor is used to detect the amount of water in the bottle and to alert the user when the water level is running low. This sensor is particularly useful for individuals who lead an active lifestyle and may forget to drink water regularly. The sensor can be programmed to send notifications to the user's smartphone when the water level is low, reminding them to refill the bottle.

ABSTRACT

In today's world, everyone is busy with their work and has plenty of deadlines to meet. The present invention relates to a smart water bottle that is designed to help individuals monitor and improve their hydration levels throughout the day. The water bottle is equipped with sensors that can detect the amount of water being consumed,

and a built-in computer that can process this data and provide real-time feedback to the user. This feedback may include reminders to drink more water, as well as information on the user's hydration levels and progress towards their daily water intake goals. The smart water bottle may also include additional features, such as a mobile app that can be used to track water intake and receive reminders on a user's smartphone or other mobile device. The invention offers a simple and convenient way for individuals to stay hydrated and improve their health and well-being, by providing an easy and effective way to track and manage water intake.

WORKING PROCEDURE

A smart water bottle with a temperature sensor and water level sensor works by using advanced sensors and built-in software to track and manage water intake and temperature throughout the day. The following is a general overview of the working procedure of the smart water bottle: The user fills the smart water bottle with water and turns it on. The water level sensor in the smart water bottle detects the amount of water being consumed and transmits this data to the built-in computer. The temperature sensor in the smart water bottle detects the temperature of the water and transmits this data to the built-in computer. The built-in computer processes this data and uses it to calculate the user's hydration level and progress toward their daily water intake goals. Overall, the working procedure of the smart water bottle with temperature sensor and water level sensor is designed to provide a comprehensive and convenient way for individuals to stay hydrated and monitor their water temperature. By using advanced sensor technology and built-in software, the smart water bottle is able to provide real-time feedback and tracking of water intake and temperature, making it easy for users to stay on top of their hydration needs and preferences throughout the day.

OUTPUT FROM THE PROCESS

The smart water bottle is able to complete or achieve its main objective successfully and the product or the device can be used by the mass commercially and everyone can utilize its benefit efficiently.
